

training.

for Law Enforcement

Increased emphasis is being placed on **active shooter** situations, **mass-casualty incident** responses, **overdose** emergencies, and **tourniquet** application in today's law enforcement environment...but what's seemingly being forgotten about is how to train your officers in each of these different disciplines. Should your FTO staff train its officers on each of these topics? How about your local technical college? *Do your instructors even have enough experience and background knowledge to be able to effectively teach your officers on these subjects?*

Why not look at an alternative option...why not have an established & experienced EMS training company teach your officers about these **medical & trauma** situations? Why not have **emergency medical solutions, llc** do it?

As an independent training & consulting company, we're flexible with our course options, delivery methods, and we have no travel restrictions or technical college boundaries to worry about. We can travel to your community, hold a regional course in your area, or hold an off-site course that your officers can travel to. We don't charge per-student enrollment fees, there's no minimum class size requirements, and we're flexible with our course start times. Here's a few course options that we have available and can bring to your department:

Emergency Response Trauma Tactics™ (ERTT™)

So much focus is being placed on training EMS providers to become TEMS providers...but what about training your officers on how to care for themselves while EMS responds? When should you really use a tourniquet? How can you care for multiple casualties at an active shooter situation? What is a serious traumatic injury, and when is bleeding critical?

3 Hours

Tactical Medical Officer™ (TMO™)

Medical response has become a common addition to the responsibilities of many law enforcement officers...but medical training hasn't been a major focal point to go with it! This course works to supplement Emergency Medical Responder training by providing a tactical, law enforcement, approach toward medical/trauma emergency response and patient care.

20 Hours

Small-Scale MCI Tabletop

A three-vehicle accident occurs at a local busy intersection...there are seven patients involved...and your officer is first on scene...now what? This tabletop exercise course will look at patient triage, EMS operations & considerations on multi-patient scenes, and what your officers can do during mass-casualty incident situations.

2 Hours

OVERDOSE EMERGENCIES & Naloxone Administration

Overdose Emergencies & Naloxone Administration

As the "opiate overdose epidemic" increases in our state & nation, law enforcement officers are often first on-scene to such emergencies. Whether your department plans to implement Naloxone (Narcan) administration into its practices or not, understanding overdose emergencies and proper patient management is crucial in order to effectively manage our scenes.

1 Hour

Because we're here to offer flexible training solutions, we'll even work with you to look at alternative funding options within your region that may decrease the cost of your training courses, or even make them **FREE!** For larger departments, we can even offer our courses at multiple times in order to accommodate shift changes and on-/off-duty training needs. Promoting combined training and local interaction, we can work with your department to include neighboring departments in order to maximize your training dollars and increase consistency through shared information. Looking at TOTAL training costs, for example, our 3-hour ERTT™ course would cost approximately \$200-\$250 when offered in most locations throughout Northeast Wisconsin (Instruction Fee + Travel Fee + Materials Fee).
